PRFAQ Document

Project Name: Multi-Agent Team Sentiment & Growth Feedback System

Subtitle: Empowering Engineering Managers with Continuous Insights for Culture, Career, and Capability Building

Press Release

FOR IMMEDIATE RELEASE

Multi-Agent Team Sentiment & Growth Feedback System: Turning Engineering Team Feedback into Measurable Growth

AI-powered, agentic platform to help Engineering Managers continuously understand and act on team feedback across culture, career growth, capability development, and wellbeing.

Fuquay-Varina, NC, February 22 — Today we announce the launch of the **Multi-Agent Team Sentiment & Growth Feedback System**, an AI-powered, agentic platform designed to help Engineering Managers (EMs) continuously understand and act on team feedback across culture, career growth, capability development, and wellbeing.

Modern engineering teams operate in fast-moving environments. Yet, Engineering Managers often lack structured, recurring, and actionable feedback loops to identify concerns around work-life balance, training needs, burnout risk, and career progression. Traditional annual surveys are static, delayed, and disconnected from real action.

The Multi-Agent Team Sentiment & Growth Feedback System changes this paradigm by delivering:

🚀 Feedback as a Service

Automated, periodic pulse surveys tailored to engineering teams, covering:

- Learning & skill development
- Career progression clarity
- Work-life balance & wellbeing
- Team collaboration & culture
- Leadership support

🤖 Dynamic Agentic Adaptation

A multi-agent AI system analyzes trends and dynamically refines future surveys based on prior responses—surfacing emerging themes, identifying risks early, and personalizing follow-up questions.

📊 Insights to Action

The platform converts raw sentiment into:

- Executive-ready summaries
- Risk heatmaps
- Growth opportunity dashboards
- Suggested action plans with measurable KPIs
- Follow-up tracking mechanisms

🧑‍💻 Engineering Manager Enablement

EMs receive:

- Weekly or monthly summaries
- Early-warning alerts (burnout, disengagement, attrition risk)
- AI-generated coaching suggestions
- Structured 1:1 conversation prompts
- Training recommendations aligned to skill gaps

By transforming continuous feedback into measurable actions, the system helps improve retention, boost engagement, and accelerate team capability building.

Availability: Pilot programs begin Q3 with select engineering organizations.

Contact: krishna.acharya@k-acharya.com

Key Capabilities:

- Feedback as a Service: Automated periodic pulse surveys covering learning, career growth, wellbeing, collaboration, and leadership support.
- Dynamic Agentic Adaptation: Multi-agent AI system refines surveys based on prior responses and emerging themes.
- Insights to Action: Converts sentiment into executive summaries, risk heatmaps, dashboards, and measurable action plans.
- Engineering Manager Enablement: AI-generated coaching suggestions, structured 1:1 prompts, and training recommendations.

Frequently Asked Questions (FAQ)

1. What problem are we solving?

Engineering Managers lack structured and recurring feedback loops to identify morale shifts, burnout signals, and career growth concerns. This results in reduced engagement and higher attrition. The system closes the loop from feedback to measurable action.

2. Who is the primary customer?

Primary: Engineering Managers and Directors of Engineering. Secondary: HR Business Partners, People Operations, VP Engineering, CTO.

3. What makes this solution unique?

Multi-agent architecture including Survey Design Agent, Sentiment Analysis Agent, Growth Gap Agent, Wellbeing Risk Agent, Action Plan Agent, and Tracking Agent for specialization and explainability.

4. How does the end-to-end flow work?

Step 1: Survey Trigger.
Step 2: Multi-Agent Processing.
Step 3: Dashboard Generation.
Step 4: AI Action Plan Creation.
Step 5: Outcome Tracking and KPI measurement.

5. What are the key success metrics?

Survey response rate (>75%), engagement uplift, burnout reduction, voluntary attrition decrease, internal mobility increase, and action plan completion rate.

6. How is privacy ensured?

Aggregation thresholds, PII redaction, anonymization options, enterprise-grade encryption, and no raw response exposure in anonymized mode.

7. What is the long-term vision?

Phase 1: Pulse Surveys. Phase 2: Action Plan Automation. Phase 3: Career Personalization Engine. Phase 4: Predictive Attrition & Promotion Models.

8. How is “agentic adaptation” implemented?

The system:

1. Detects repeated themes (e.g., “lack of growth clarity”)
2. Expands future surveys with deeper follow-ups
3. Suppresses redundant questions
4. Introduces emerging trend probes
5. Learns from action outcome impact

This ensures surveys evolve with team needs instead of remaining static.

9. What integrations are supported?

- Slack / Microsoft Teams
- Jira
- HRIS (Workday, BambooHR)
- LMS platforms
- Calendar data (for workload patterns)

10. What risks exist and how are they mitigated?

Risk	Mitigation
Survey fatigue	Adaptive question reduction
Manager inaction	Automated reminders + KPI tracking
AI hallucination	Retrieval-based grounding
Privacy concerns	Strong anonymization guardrails
Over-reliance on sentiment score	Contextual narrative + trend comparison

---

11. What guardrails are built in?

- Grounded recommendations using historical team data
- Human-in-the-loop review for high-risk alerts
- Bias detection in sentiment scoring
- Fallback to rule-based insights if AI confidence is low

12. Why now?

- Hybrid work has reduced informal feedback loops

- Burnout levels are rising in tech
- Retention costs are increasing
- AI agent systems are mature enough for explainable automation
- EM bandwidth is constrained

🎯 Working Backwards Summary

If we are successful:

- EMs will make data-informed decisions weekly.
- Teams will feel heard continuously, not annually.
- Culture shifts will be measurable.
- Career growth discussions will become structured.
- Retention and engagement will improve.

Feedback from the first presentation on Feb 22, 2026: These can be future vision if can't be done in the first iteration

- Deep dive into understanding the painpoint. For e.g., what's the cause of the burn out.
- Can be implemented in more frequency for e.g. in a project after every sprint cycle
- Survey can be aligned to stakeholder's expectation as well. So, we can use a document that defines stakeholder's expectation, company's mission/vision etc.

Think about the following points when designing the system architecture

- How the system is getting triggered
- Data point
- Sub agents
- What level of autonomy we need
